

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (Currently amended) An information processor to analyze the right of access to a database having a data file in a form of a structured document, the information processor comprising:

a query automaton generation unit for generating a query automaton from a path expression in which a retrieval condition for the database is described;

an access control automaton generation unit for generating an access control automaton from an access control policy in which an access control rule is described; and

a logic operation unit for deciding access rights in database retrieval using the path expression by performing logic operations related to the query automaton generated by the query automaton generation unit and the access control automaton generated by the access control automaton generation unit, without accessing said data file stored in said database.

2. (Original) The information processor of claim 1, further comprising a schema automaton generation unit for generating a schema automaton from a

schema showing a structure of the data file stored in the database wherein the logic operation unit performs decision of the access right in consideration for the schema automaton generated by the schema automaton generation unit.

3. (Original) The information processor of claim 2, further comprising a path table control unit for controlling path table describing paths of the data file stored in the database wherein the schema automaton generation unit generates the schema automaton from the path table controlled by the path table control unit.

4. (Original) The information processor of claim 1, further comprising a path expression extraction unit for extracting the path expressions from a query expression specifying a retrieval method for the database.

5. (Original) The information processor of claim 4, further comprising a query expression access right decision unit for deciding access rights in the database retrieval by the query expression based on decision results of access rights, which are obtained by the logic operation unit, for the individual path expressions extracted from the query expression.

6. (Currently Amended) An information processor which analyzes access rights to a database having a data file comprising a structured document, the information processor comprising:

a path table control unit for controlling a path table describing paths of a data file stored in the database; and

an access right decision unit for selecting a predetermined path in the path table controlled by the path table control unit by a path expression describing a retrieval condition for the database, applying an access control policy describing access control rules and deciding an access right in database retrieval by the path expression with respect to the predetermined path, said selecting, applying and deciding being performed prior to retrieving said structured document in said database.

7. (Original) The information processor of claim 6, further comprising:

a query automaton generation unit for generating a query automaton from a path expression in which a retrieval condition for the database is described; and

an access control automaton generation unit for generating an access control automaton from the access control policy in which the access control rule is described,

wherein the access right decision unit selects the predetermined path by use of the query automaton generated by the query automaton generation unit

and decides an access right to the predetermined path by use of the access control automaton generated by the access control automaton generation unit.

8. (Original) The information processor of claim 6, further comprising a path expression extraction unit for extracting the path expressions from a query expression specifying a retrieval method for the database.

9. (Original) The information processor of claim 8, further comprising a query expression access right decision unit for deciding access rights in the database retrieval by the query expression based on decision results of access rights, which are obtained by the access right decision unit, for the individual path expressions extracted from the query expression.

10. (Currently amended) A database retrieval system, comprising:  
a database storing an XML document; and  
a preliminary an access rights analysis device which decides, based on path expressions describing retrieval conditions used in retrieval for the database and an access control policy describing access control rules, to which one of

- 1) always permitted,
- 2) always denied, and
- 3) indeterminate

an access right in the database retrieval using the path expressions corresponds, said preliminary access rights analysis device deciding said access rights without retrieving said XML document.

11. (Currently amended) The database retrieval system of claim 10, wherein the access rights analysis device includes;

a query automaton generation unit for generating a query automaton from a path expression in which a retrieval condition for the database is described;

an access control automaton generation unit for generating an access control automaton from the access control policy in which an access control rule is described; and

a logic operation unit for deciding access rights in database retrieval using the path expression by performing logic operations related to the query automaton generated by the query automaton generation unit and the access control automaton generated by the access control automaton generation unit.

12. (Original) The database retrieval system of claim 11, further comprising:

a path expression extraction unit for extracting the path expressions from a query expression specifying a retrieval method for the database; and

a query expression access right decision unit for deciding access rights in the database retrieval by the query expression based on decision results of access rights, which are obtained by the logic operation unit, for the individual path expressions extracted from the query expression.

13. (Original) The database retrieval system of claim 10, further comprising the access rights analysis device including:

a path table control unit for controlling a path table describing paths of a data file stored in the database; and

an access right decision unit for selecting a predetermined path in the path table controlled by the path table control unit by a path expression describing a retrieval condition for the database, applying the access control policy describing the access control rules and deciding an access right in database retrieval by the path expression with respect to the predetermined path.

14. (Original) The database retrieval system of claim 13, further comprising:

a path expression extraction unit for extracting the path expressions from a query expression specifying a retrieval method for the database; and

a query expression access right decision unit for deciding access rights in the database retrieval by the query expression based on decision results of

access rights, which are obtained by the access right decision unit, for the individual path expressions extracted from the query expression.

15. (Original) An access rights analysis method for analyzing the right of access to a database storing an XML document by use of a computer, comprising the steps of:

generating a query automaton from a path expression in which a retrieval condition for the database is described, generating an access control automaton from an access control policy in which an access control rule is described and storing the generated query automaton and access control automaton in a predetermined storage means; and

performing logic operations related to the query automaton and the access control automaton, which are stored in the predetermined storage means, and deciding an access right in database retrieval using the path expression without checking the XML documents stored in the database.

16. (Currently Amended) An access rights analysis method for analyzing the right of access to a database storing an XML document by use of a computer, comprising the steps of:

selecting a predetermined path from a path table, which is stored in a predetermined storage means and describes paths of a data file stored in the

database, by a path expression describing a retrieval condition for the database; and

applying an access control policy describing access control rules and, without checking the data file stored in the database, deciding an access right in database retrieval by the path expression with respect to the predetermined path.

17. (Currently Amended) A program for analyzing the right of access to a database handling a data file as a structured document, by controlling a computer, the program causing the computer to function as:

a query automaton generation means for generating a query automaton from a path expression in which a retrieval condition for the database is described;

an access control automaton generation means for generating an access control automaton from an access control policy in which an access control rule is described; and

a logic operation means for deciding access rights in database retrieval using the path expression by performing logic operations related to the generated query automaton and access control automaton, without accessing said data file.

18. (Currently amended) The program of claim 17, further causing the computer to function as:

a path expression extraction means for extracting the path expressions from a query expression specifying a retrieval method for the database; and

a query expression access right decision means for deciding access rights in the database retrieval by the query expression based on decision results of access rights for the individual path expressions extracted from the query expression.

19. (Currently Amended) A program for analyzing the right of access to a database handling a data file, described in a form of a structured document, by controlling a computer, the program allowing the computer to function as:

a path table control means for controlling a path table describing paths of a data file stored in the database; and

an access right decision means for selecting a predetermined path in the path table controlled by the path table control unit by a path expression describing a retrieval condition for the database, applying an access control policy describing access control rules and deciding the presence of an access right in database retrieval by the path expression with respect to the predetermined path without accessing said data file.

20. (Original) The program of claim 19, further causing the computer to function as:

a path expression extraction means for extracting the path expressions from a query expression specifying a retrieval method for the database; and

a query expression access right decision means for deciding access rights in the database retrieval by the query expression based on decision results of access rights for the individual path expressions extracted from the query expression.

21. (New) The database retrieval system of claim 10 wherein, if said access right decided by said preliminary access rights analysis device is indeterminate, said database retrieval system retrieving said XML document to determine access rights.
